

## Prtf1 Regex and OpenRefine

Author Name(s): Konrad, Kasper

Task 1: List regex that extracts dates from <http://bit.ly/regexexercise2> and formats them as YYYY-MM-DD?

URL for the solution: <https://regex101.com/r/rW025K/2>

Brief explanation: Regular expressions can be used to search for dates and names. To extract all the dates and put them into the format of YYYY-MM-DD, we divided the date, month and year into three separate groups using the regular expression:

`(\d{1,2}).\s?(\d{1,2}).\s?(\d{4})`

I started with `\d` to match the regex with digits in the text, then `{1,2}` to match any dates with either 1 or 2 digits as a date, then `"."` matches any character that the formatting of the dates may have used such as `"- . /"`, followed by `\s` and `?` to match any instances where there are spaces between the sections of the date. I then repeated this for the month and year section of the dates using brackets to divide the month, date and years.

After we successfully divided them into categories, we clicked on substitution. In substitution we could control the three categories by putting them in the correct order, year, month and date with the following input:

`$3-$2-$1`

We are now able to express the dates in the format: YYYY-MM-DD.

### Task 2 Regex to convert stopwordslist between R and Voyant format

R to Voyant: <https://regex101.com/r/eXZuyj/1>

Brief explanation: `"\s"` matches the different characters used in the format for R, both the characters `" , "` and the space between words `(\s*)`. I then bracket this expression and substitute with `\n` which matches a newline to format the stopwordslist to Voyant

We must be aware that the first and last word needs one quotation mark each, which needs to be added.

Voyant to R: <https://regex101.com/r/tOsvlB/1>

Brief explanation: `\n` matches a newline, this means that all the space between the words on separate lines will be marked. I then bracket this expression and substitute with citationmarks and a comma to format the stopwordslist to R

### Task 3 Does OpenRefine alter the raw data during sorting and filtering?

NO

Brief explanation: OpenRefine does not alter the raw data when you sort or filter a dataset. Sorting can change the order in which the rows are displayed on the screen, and filtering can hide rows that do not meet the selected criteria. The underlying data remains the same. The raw data is only changed when you apply transformations such as editing values, splitting or merging columns, or using other data-cleaning functions.

Task 4: Which two months are reported as the most water-deprived/dryest by the interviewed farmer households (SAFI\_openrefine.csv)?

Answer: The two most water deprived months in Mozambique and Tanzania are October and September with 74 and 70 respective mentions.

Task 5: Challenge - 10 most common occupations among ..... in [1801 Aarhus](#)

- Total number of people in your selected cohort:  
3,570 matching rows, this means that 3570 women fits into the cohort within the perimeters I have selected.
- Define what is / is not an occupation:  
I choose to count occupations that include doing some job or task. I chose not to include things like Vanvittig or Hospitalslem.
- 10 most frequent occupations (list number of people practising that job with each entry)
